                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC This is a AL-2-long (AL-21) protein. The AL-2 is a novel Eph-related tyrosine kinase receptor ligand. AL-2 can be administered to patients in CC whom the nervous system has been damaged by trauma, surgery, stroke, CC ischaemia, infection, metabolic disease, nutritional deficiency, CC malignancy, or toxic agents, to promote the survival or growth of CC neurons. They can be used to treat motoneuron disorders such as CC amportrophic lateral sclerosis (Lou Gehrig's disease), Bell's palsy, and CC various conditions involving spinal muscular atrophy, or paralysis. AL-2 CC can be used to treat human neurodegenerative disorders, such as CC Alzheimer's disease, Parkinson's disease, epilepsy, demyelinating CC diseases such as multiple sclerosis, Huntingtons chorea, Down's syndrome, CC nerve deafness, Menier's disease, and other disorders of the cerebellum. CC an be used as cognitive enhancer, to enhance learning particularly in dementias or trauma, since they can promote axonal outgrowth and CC binding Eph-family receptors and cortical neurons that express AL-2 can also be used for wound healing, i.e. accelerating neovascularisation of, e.g. burns and ulcers. The encoding nucleic acids are useful in preparing antibodies that specifically bind to the AL-2 can also be used for wound healing, i.e. accelerating nucleic acids are useful in preparing antibodies that specifically bind to the AL-2 can encodian. The antibodies and the AL-2 antagonists are useful in diagnosing and treating anglogenesis. They can also be used for the treatment of cumoulating anglogenesis. They can also be used for the treatment of cumoulating anglogenesis and the AL-2 antagonists can be used for modulating anglogenesis. They can also be used for the treatment of cumoulating anglogenesis and the AL-2 antagonists are useful in diagnosing and treatment of cumounts, acute myeloid leukaemia (CML), chronic myeloid leukaemia (CML), chronic myeloid leukaemia (CML), generals and rheumatoid arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                               The amino acid sequence was deduced from a human foetal brain cDNA clone (C (see AAT89519). Lerk-8 binds to the cell surface receptors hek and elk, C which are members of the eph/elk family of receptor tyrosine kinases. CC Lerk-8 polypeptides, especially soluble polypeptides comprising amino CC acid residues -27 to 142-197 of the full-length protein, can be expressed CC in transformed host cells. These polypeptides can be used to purify hek CC or elk proteins, and to purify or identify cells that express hek or elk CC on the surface. Such cells can be used in various in vitro studies or in CC vivo procedures, e.g. neural cells expressing elk can be administered to CC a mammal afflicted with a neurodegenerative disorder. The Lerk-8 CC polypeptides can also be used to deliver diagnostic or therapeutic agents CC to these cells (e.g. leukaemia cells). The Lerk-8 DNA and polypeptides CC can also be used to: treat disorders mediated by defective or consufficient amounts of Lerk-8; to treat disorders such as injury to contain tissue or neurologic disease; to promote angiogenesis; and for CC wound healing or stimulating neovascularisation of grafted tissues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
This is a AL-2-short (AL-2s) protein. The AL-2 is a novel Eph-related tyrosine kinase receptor ligand. AL-2 can be administered to patients whom the nervous system has been damaged by trauma, surgery, stroke, ischaemia, infection, metabolic disease, nutritional deficiency, malignancy, or toxic agents, to promote the survival or growth of neurons. They can be used to treat motoneuron disorders such as
                                                                                                                                                                                                                           Human AL-2 neurotrophic factor and related DNA - used for, e.g. treating neurologic disorders, angiogenesis or rheumatoid arthritis or for wound healing.
                                                                                                                                                                                                                                                                                                                           WPI; 1997-535837/49.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC amyotrophic lateral sclerosis (Lou Gehrig's disease), Bell's palsy, and crarious conditions involving spinal muscular atrophy, or paralysis. AL-2 CC can be used to treat human neurodegenerative disorders, such as CC Alzheimer's disease, Parkinson's disease, epilepsy, demyelinating CC diseases such as multiple sclerosis, Huntingtons chorea, Down's syndrome, CC nerve deafness, Menier's disease, and other disorders of the cerebellum. CC an be used as cognitive enhancer, to enhance learning particularly CC in dementias or trauma, since they can promote axonal outgrowth and CC synaptic plasticity, particularly of hispocampal neurons that express AL-C2 binding Eph-family receptors and cortical neurons that express AL-C3 and also be used for wound healing, i.e. accelerating neovascularisation of, e.g. burns and ulcers. The encoding nucleic acids are useful in preparing antibodies that specifically bind to the AL-2 cotein. The antibodies and the AL-2 antagonists are useful in diagnosing and treating various neuronal disorders. AL-2 antagonists can be used for tumours, acute myeloid leukaemia (AML), chronic myeloid leukaemia (CML), neovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

It is encoded by a cDNA (clone (AAF60966) obtd. from a human foetal brain cDNA library. The novel receptor ligand can be expressed in transformed host cells and used in methods for regulating the development, maintenance or regeneration of different cells (e.g. neurons) and tissues in vivo and in vitro. Soluble NLERK2 peptides can be used to treat injury, disease or abnormality in the nervous system, and membrane-bound NLERK2 to modulate proliferation, different or survival e.g. in grafting procedures or transplantation. NLERK2 can also be used to raise antibodies for use in immunotherapy, and to detect anti-NLERK2 antibodies that may occur in some autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid mol. encoding ligand for eph-related kinase - useful for treatment of, pref. neuronal, cells to increase survival, proliferation and differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                                                                                                                                                                                     The invention describes a method of identifying a modulator of binding CC between a Tie receptor tyrosine kinase and an Ephrin ligand. The method CC composition in the presence and in the absence of a putative modulator CC composition in the presence and in the absence of a putative modulator CC in the presence and in the absence of the putative modulator. The method CC is useful for identifying a modulator of binding between a Tie receptor CC tyrosine kinase and an Ephrin ligand. Modulators identified from the CC method are useful in modulating angiogenic processes, including CC lymphangiogenesis, for treating diseases associated with aberrant Ephrin-CC Tie biology, aberrant growth, migration or proliferation of cells that CC express a Tie receptor, or for promoting growth of vessel or CC chronic compound, or a tissue graft or transplant). This is the amino CC acid sequence of human Ephrin-B3, a member of the Ephrin-B subclass of CC ligands that are bound to the membrane via a transmembrane domain and CC short cytoplasmic tail and function as Eph receptor ligands
                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                    The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression in the first soft tissue samples and comparing the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma—upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 2; SEQ ID NO 4256; 210pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          δ
                                                                 The invention relates to a novel use of ephrin, ephrin inhibitors, and ephrin receptors for alleviating a symptom of a disorder having reduced ephrin receptors for alleviating a symptom of a disorder having reduced levels of hematopoiesis, having increased levels of cellular proliferation in an intestinal tract, or having an abnormal level of cellular proliferation in a tissue. A composition of the invention has cytostatic, antianemic, antianemic
                                                                                                                                                                                                                                                                                                             Use of ephrin and its molecules for alleviating a symptom or a dison with reduced levels of hematopoiesis, increased levels of cellular proliferation in an intestinal tract, or abnormal level of cellular proliferation in a tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      09-NOV-2001; 2001US-0345206P.

Its amino acid sequence was deduced from a human frontal cortex cDNA clone (AAT69808). Recombinant Elf-6, truncated soluble polypeptides comprising the extracellular domain of Elf-6, and Ef1-6 ligandbodies comprising soluble Ef1-6 and the Fc portion of IgG can be expressed in host cells. These can be used to support neuronal and other Eph receptor-bearing cell populations for treatment of the receptor-bearing cell populations for treatment of the receptor in drug accepting and to raise diagnostic

```
CC ligand comprises forming a complex between a purified and isolated CC oligomerised ERRTK, or an isoform or an extracellular domain of the CC ERRTK, and the transmembrane ligand expressed on the cell. The complex CC can also be used for evaluating a substance for its ability to modulate the biological activity of a transmembrane ligand for an ERRTK, and to CC identify substances that affect or modulate a pathway regulated by a CC ERRTK. A purified and isolated oligomerised ERRTK can be used in the CC preparation of a medicament for modulating neuronal development or CC regeneration in a subject, or in a medicament for modulating axonogenesis in a subject (all claimed). The substances identified by the methods can be used to modulate axonogenesis, nerve cell interactions and CC regeneration, to treat diseases and conditions involving trauma and CC regeneration, to treat diseases and conditions involving trauma and CC disease, Huntingdon's disease, demyelinating diseases, such as multiple CC disease, mayotrophic lateral sclerosis, bacch as Mernicke's disease CC of the nervous system, deficiency diseases, such as Mernicke's disease CC and nutritional polyneuropathy, progressive supranuclear paley, Shy CC Drager's syndrome, multistem degeneration and olivo ponto cerebellar CC atrophy, peripheral nerve damage, trauma, and ischaemia resulting from cracky.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches 336;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

Identifying modulators of binding between a Tie receptor tyrosine kinase and an Ephrin ligand, useful for promoting neovascularization, comprises contacting a Tie receptor with an Ephrin in the presence of a putative

Disclosure; Page 121-122; 199pp; English

composition in the presence and in the absence of a putative modulator compound, and detecting the binding between Tie receptor and the Ephrin in the presence and in the absence of the putative modulator. The method is useful for identifying a modulator of binding between a Tie receptor tyrosine kinase and an Ephrin ligand. Modulators identified from the method are useful in modulating angiogenic processes, including lymphangiogenesis, for treating diseases associated with aberrant Ephrin-Tie biology, aberrant growth, migration or proliferation of cells that express a Tie receptor, or for promoting growth of vessel or neovascularisation (e.g. ischaemic tissue, an infarction, a new or chronic compound, or a tissue graft or transplant). This is the amino acid sequence of mouse Ephrin-B3, a member of the Ephrin-B subclass of ligands that are bound to the membrane via a transmembrane domain and short cytoplasmic tail and function as Eph receptor ligands The invention describes a method of identifying a modulator of between a Tie receptor tyrosine kinase and an Ephrin ligand. The comprises contacting a Tie receptor composition with an Ephrin of binding The method

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                     The invention relates to a novel use of ephrin, ephrin inhibitors, and ephrin receptors for alleviating a symptom of a disorder having reduced levels of hematopolesis, having increased levels of cellular proliferation in an intestinal tract, or having an abnormal level of cellular proliferation in a tissue. A composition of the invention has cytostatic, antianemic, antiinflammatory, antipsoriatic, gastrointestinal egen., dermatological, coagulant, immunostimulant, cerebroprotective, vasotropic, and antiulcer activity. The present sequence represents murine ephrin-B3.
                                                                                                                                                                                      Use of ephrin and its molecules for alleviating a symptom or a disorder with reduced levels of hematopoiesis, increased levels of cellular proliferation in an intestinal tract, or abnormal level of cellular proliferation in a tissue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to novel mitochondrial targets that can be used CC for therapeutic intervention in treating a disease associated with CC altered mitochondrial function. Specifically, it refers to a method for CC identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The CC present invention describes a method for identifying such proteins that CC can be used in the treatment of various diseases associated with altered CC mitochondrial function including diabetes mellitus, Huntington's disease, CC estevarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial CC enesphalopathy lactic acidosis and stroke (MERAS), myoclonic epilepsy CC ragged red fibre syndrome (MERRF) or cancer. Accordingly, these CC compositions have neuroprotective, nootropic, antidiabetic, antidiabetic, antidiabetic, antidiabetic, antidiabetic, activities. This polypeptide sequence is a human heart composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

It is important in cellular communication during pattern formation. Its amino acid sequence was deduced from a cDNA clone (AAT40230) isolated from a newborn mouse brain cDNA library. The ELF-2 ligand can be used to alter neurological development, oncogenesis and growth regulation, to modulate binding of ELF-2 to the Eph receptor, and in diagnostic assays

                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                          CC activate, the Htk receptor, have been identified in a variety of tissues CC using a soluble Htk-Fc fusion protein. The predicted mol.wt. of the CC using a soluble Htk-Fc fusion protein. The predicted mol.wt. of the CC murine Htk ligand protein following a signal peptide cleavage is 34 kD cc with an estimated pl of 8.9. The murine and human ligands show 96% cc homology at the amino acid level. The DNA is used to produce recombinant CC ligands; for tissue- specific typing (partic. as a marker for breast CC cancer) and as a marker for human chromosome 13. The ligands (partic. in CC soluble form) are used to activate the tyrosine kinase domain of the Htk CC receptor, i.e. to stimulate or inhibit growth, differentiation, and/or activation of cells contg. the receptor, e.g. treatment of neurodegenerative diseases, since they are strongly expressed in the CC cerebral cortex, hippocampus, striatum and cerebellum. The ligands are also useful as a control or standard in assays, for generation of CC antibodies, as a mol. wt. marker, for growth in vitro of Htk-receptor positive cells, as research agent, in screening, etc

The invention relates to a novel use of ephrin, ephrin inhibitors, and ephrin receptors for alleviating a symptom of a disorder having reduced levels of hematopoiesis, having increased levels of cellular proliferation in an intestinal tract, or having an abnormal level of cellular proliferation in a tissue. A composition of the invention has cytostatic, antianemic, antiinflammatory, antipsoriatic, gastrointestinal gen, dermatological, coagulant, immunostimulant, cerebroprotective,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of ephrin and its molecules for alleviating a symptom or a diswith reduced levels of hematopolesis, increased levels of cellular proliferation in an intestinal tract, or abnormal level of cellular proliferation in a tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ephrin; hematopoiesis; hyperproliferation; cytostatic; antianemic; antiinflammatory; antipsoriatic; gastrointestinal-gen.; dermatological; coagulant; immunostimulant; cerebroprotective; vasotropic; antiulcer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The amino acid sequence was deduced from a human foetal brain cDNA clone (see AAT89519). Lerk-8 binds to the cell surface receptors hek and elk, clowhich are members of the eph/elk family of receptor tyrosine kinases. CC Lerk-8 polypeptides, especially soluble polypeptides comprising amino cd acid residues -27 to 142-197 of the full-length protein, can be expressed in transformed host cells. These polypeptides can be used to purify hek cor elk proteins, and to purify or identify cells that express hek or elk cor the surface. Such cells can be used in various in vitro studies or in two procedures, e.g. neural cells expressing elk can be administered to ca mammal afflicted with a neurodegenerative disorder. The Lerk-8 cor these cells (e.g. leukaemia cells). The Lerk-8 DNA and polypeptides can also be used to: treat disorders such as injury to neural tissue or neurologic disease; to promote angiogenesis; and for cound healing or stimulating neovascularisation of grafted tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

CC ischemia, infection, metabolic disease, nutritional deficiency, complete the survival or growth of complete the survival or growth as complete the survival or gravalysis. AL-2 cam be used to treat human neurodegenerative disorders, such as complete the survival or gravalysis. AL-2 can be used to treat human neurodegenerative disorders, such as complete the such as multiple sclerosis, Huntingtons chorea, Down's syndrome, compared the sused as cognitive enhancer, to enhance learning particularly complete they can promote axonal outgrowth and synaptic plasticity, particularly of hippocampal neurons that express AL-2 binding Eph-family receptors and cortical neurons that express AL-2 can also be used for wound healing, i.e. accelerating newvascularisation of, e.g. burns and ulcers. The encoding nucleic acids care useful in preparing antibodies that specifically bind to the AL-2 candulating various neuronal disorders. AL-2 antagonists can be used for mounts, acute myeloid leukaemia (AML), chronic myeloid leukaemia (CML), myelodysplastic syndrome (MDS), diabetic retinopathy, neovascular Query Match Best Local Sequence 340 psoriasis B and rheumatoid arthritis 100.0%; Score 1850; DB 2; Pred. No. 2.5e-142; ; Mismatches 0; Length 340; patients stroke, in

A novel human ligand for eph-related kinase (LERK) is designated NLERK2 (AAW10637). It is encoded by a cDNA clone (AAF60966) obtd. from a human foetal brain cDNA library. The novel receptor ligand can be expressed in transformed host cells and used in methods for regulating the development, maintenance or regeneration of different cells (e.g. neurons) and tissues in vivo and in vitro. Soluble NLERKZ peptides can be used to treat injury, disease or abnormality in the nervous system, and membrane-bound NLERKZ to modulate proliferation, different or survival e.g. in grafting procedures or transplantation. NLERKZ can also be used to raise antibodies for use in immunotherapy, and to detect anti-NLERKZ antibodies that may occur in some autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid mol. encoding ligand for eph-related kinase - useful for treatment of, pref. neuronal, cells to increase survival, proliferation and differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LERK; ligand for eph-related kinase; ERK; NLERK2; receptor protein tyrosine kinase; cell proliferation; cell differentiation; cell survival; nerve cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nicola NA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC The invention describes a method of identifying a modulator of binding CC between a Tie receptor tyrosine kinase and an Ephrin ligand. The method CC composition in the presence and in the absence of a putative modulator CC compound, and detecting the binding between Tie receptor and the Ephrin CC in the presence and in the absence of the putative modulator in the presence and in the absence of the putative modulator. The method is useful for identifying a modulator of binding between a Tie receptor CC tyrosine kinase and an Ephrin ligand. Modulators identified from the CC method are useful in modulating angiogenic processes, including CC lymphangiogenesis, for treating diseases associated with abserrant Ephrin-CC Tie biology, abserrant growth, migration or proliferation of cells that CC express a Tie receptor, or for promoting growth of vessel or covascularisation (e.g. ischaemic tissue, an infarction, a new or CC chronic compound, or a tissue graft or transplant). This is the amino CC acid sequence of human Ephrin-B3, a member of the Ephrin-B subclass of CC ligands that are bound to the membrane via a transmembrane domain and CC short cytoplasmic tail and function as Eph receptor ligands
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches 340;

```

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples and comparing the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor. Sequence 340 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel use of ephrin, ephrin inhibitors, and ephrin receptors for alleviating a symptom of a disorder having reduced levels of hematopoiesis, having increased levels of cellular proliferation in an intestinal tract, or having an abnormal level of cellular proliferation in a tissue. A composition of the invention has cytostatic, antianemic, antiinflammatory, antipsoriatic, gastrointestinal gen., dermatological, coagulant, immunostimulant, cerebroprotective, vasotropic, and antiulcer activity. The present sequence represents murine ephrin-B3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of ephrin and its molecules for alleviating a symptom or a disorder with reduced levels of hematopoissis, increased levels of cellular proliferation in an intestinal tract, or abnormal level of cellular proliferation in a tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 340 AA;

Its amino acid sequence was deduced from a human frontal cortex cDNA clone (AAT69808). Recombinant Elf-6, truncated soluble polypeptides comprising the extracellular domain of Elf-6, and Ef1-6 ligandbodies comprising soluble Ef1-6 and the Fc portion of IgG can be expressed in host cells. These can be used to support neuronal and other Eph receptor-bearing cell populations for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid encoding Ef1-6 ligand protein - used for promoting growth and proliferation of neuronal cells and in drug screening.

This is a AL-2-long (AL-21) protein. The AL-2 is a novel Eph-related CC tyrosine kinase receptor ligand. AL-2 can be administered to patients in CC whom the nervous system has been damaged by trauma, surgery, stroke, CC ischaemia, infection, metabolic disease, nutritional deficiency, crowing system has been damaged by trauma, surgery, stroke, CC malignancy, or toxic agents, to promote the survival or growth of coneurons. They can be used to treat motoneuron disorders such as CC amyotrophic lateral sclerosis (Lou Gehrig's disease), Bell's palsy, and CC various conditions involving spinal muscular atrophy, or paralysis. AL-2 can be used to treat human neurodegenerative disorders, such as CC can be used as multiple sclerosis, Huntingtons chorea, Down's syndrome, CC diseases such as multiple sclerosis, Huntingtons chorea, Down's syndrome, CC diseases such as multiple sclerosis, Huntingtons chorea, Down's syndrome, CC in dementias or trauma, since they can promote axonal outgrowth and CC synaptic plasticity, particularly of hippocampal neurons that express AL-2 binding Eph-family receptors and cortical neurons that express AL-2. AL can also be used for wound healing, i.e. accelerating necleic acids are useful in preparing antibodies that specifically bind to the AL-2 protein. The antibodies and the AL-2 antagonists are useful in diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                Human AL-2 neurotrophic factor and related DNA - used to develop products for, e.g. treating neurologic disorders, angiogenesis disorders, tumours or rheumatoid arthritis or for wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AL-21; AL-2; AL-2-long; human; treatment; neurological disorder; tumour; rheumatoid arthritis; wound healing; paralysis; angiogenesis; leukaemia; psoriasis; Alzheimer's disease; epilepsy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    30-OCT-1997

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC ligand comprises forming a complex between a purified and isolated CC coligomerised ERRTK, or an isoform or an extracellular domain of the CERRTK, and the transmembrane ligand expressed on the cell. The complex CC can also be used for evaluating a substance for its ability to modulate the biological activity of a transmembrane ligand for an ERRTK, and to C identify substances that affect or modulate a pathway regulated by a CC ERRTK. A purified and isolated oligomerised ERRTK can be used in the CC preparation of a medicament for modulating neuronal development or CC regeneration in a subject, or in a medicament for modulating axonogenesis in a subject (all claimed). The substances identified by the methods can be used to modulate axonogenesis, nerve cell interactions and CC regeneration, to treat diseases and conditions involving trauma and CC regeneration, to treat diseases and conditions involving trauma and CC disease, Huntingdon's diseases, demyelinating diseases, such as multiple cf. the nervous system, such as Alzheimer's disease such as multiple cf. the revous system, deficiency diseases, such as Wernicke's disease CC and nutritional polyneuropathy, progressive supranuclear paley, Shy CR Drager's syndrome, multistem degeneration and olivo ponto cerebellar CC estroke

                                                                                                                                                                 문
                                                                                                                                                                                                                                                                                                                                                     The invention describes a method of identifying a modulator of binding between a Tie receptor tyrosine kinase and an Ephrin ligand. The method comprises contacting a Tie receptor composition with an Ephrin composition in the presence and in the absence of a putative modulator composition in the presence and in the absence of the putative modulator. The method is useful for identifying a modulator of binding between a Tie receptor tyrosine kinase and an Ephrin ligand. Modulators identified from the method are useful in modulating angiogenic processes, including the biology, aberrant growth, migration or proliferation of cells that express a Tie receptor, or for promoting growth of vessel or neovascularisation (e.g. ischaemic tissue, an infarction, a new or acid sequence of mouse Ephrin-B3, a member of the Ephrin-B subclass of ligands that are bound to the membrane via a transmembrane domain and

for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.

It is important in cellular communication during pattern formation. Its amino acid sequence was deduced from a cDNA clone (AAT40230) isolated from a newborn mouse brain cDNA library. The ELF-2 ligand can be used to alter neurological development, oncogenesis and growth regulation, to modulate binding of ELF-2 to the Eph receptor, and in diagnostic assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 334 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eph receptor ligand, ELF-2, and DNA encoding it is used prevent neurological diseases, and to modulate binding receptor, e.g. to prevent or treat tumour formation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC Mouse (AAT16470) and human (AAT16471) Htk ligand which bind to, and CC activate, the Htk receptor, have been identified in a variety of tissues CC using a soluble Htk-Fc fusion protein. The predicted mol.wt. of the CC murine Htk ligand protein following a signal peptide cleavage is 34 kD CC with an estimated pl of 8.9. The murine and human ligands show 96% CC homology at the amino acid level. The DNA is used to produce recombinant CC ligands; for tissue- specific typing (partic. as a marker for breast CC cancer) and as a marker for human chromosome 13. The ligands (partic. in CC soluble form) are used to activate the tyrosine kinase domain of the Htk CR receptor, i.e. to stimulate or inhibit growth, differentiation, and/or CC activation of cells contg. the receptor, e.g. treatment of neurodegenerative diseases, since they are strongly expressed in the CC cerebral cortex, hippocampus, striatum and cerebellum. The ligands are CC also useful as a control or standard in assays, for generation of cantibodies, as a mol. wt. marker, for growth in vitro of Htk-receptor costive cells, as research agent, in screening, etc

A composition of the invention has cytostatic, antianemic, antiinflammatory, antipsoriatic, gastrointestinal egen, dermatological, coagulant, immunostimulant, cerebroprotective, vascropic, and antiulcer activity. The present sequence represents

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
